A few points about Ester!

Esters are derived from plants. Unlike other synthetic oils on the market, such as PAO polyalphaolefens and hydrocracked (extra high viscosity index (XHV)) which are derived from crude oil. Esters have better lubricating properties and bring engine oils to new levels in performance and endurance.

1. Esters have a higher resistance to thermal breakdown. Basically a higher flash point, up to 70 degrees celsius more than normal multigrade oil. This means in the hotter parts of the engine, such as the cylinder walls and bearings, where there is extreme heat, the oil doesn't burn off and leave carbon deposits. (When carbon deposits are formed, the detergent present in most oils will disperse these, which then mix with the oil, breaking down its lubricating properties and turning it black.

2. The Ester molecules (complex Ester in MOTUL) are double bonded, which effectively gives the oil an unshearable film.

3. MOTUL Ester molecules are polar static negative; (The carbon molecule has a negative polarity that makes the oil magnetic) and the oil sticks to every part of the metal inside the engine at all times, even when the motor is not running, so at cold startup, there's oil already there.

4. Esters reduce friction, which keeps the engine cooler and allows it to develop more horsepower.

5. Esters are produced from plants. They are a renewable product that are also biodegradable. That's great for your engine and great for our environment.
